Cause of death in adult kidney Tx patients.....	23

Introduction

This chapter describes the population of patients with end-stage kidney disease (ESKD) who had a functioning kidney transplant (Tx) in the UK at the end of 2020 (figure 4.1). Patients can receive their first Tx either pre-emptively, i.e. without spending any time on dialysis, or while on dialysis. Donors in both pathways may be either a living kidney donor (LKD) or a deceased kidney donor – receiving a kidney from a donor after brain death (DBD) or a donor after circulatory death (DCD). If a Tx begins to fail a patient may be considered for a second (or subsequent) Tx, which again can come from a living or deceased donor.

Potential Tx recipients who pass rigorous assessments are wait-listed, which can occur before or after they have started dialysis. The majority of kidneys received through wait-listing are from deceased donors. The cohort of patients living with a kidney Tx in a centre not only reflects differences in underlying population case-mix, but also differences in the rates of acceptance onto kidney replacement therapy (KRT). This includes wait-listing rates and live donor programmes, survival of the Tx graft and its recipient, as well as the care and survival of patients on dialysis therapies, as described in other chapters of this report.

Figure 4.1 Pathways adult patients could follow to be included in the UK 2020 prevalent Tx population

Note that patients receiving dialysis for acute kidney injury (AKI) are only included in this chapter if they had a timeline or KRT modality code for Tx at the end of 2020 or if they had been on KRT for ≥ 90 days and were on Tx at the end of 2020.

AKI – acute kidney injury; CKD – chronic kidney disease; HHD – home haemodialysis; ICHD – in-centre haemodialysis; PD – peritoneal dialysis; Tx - Transplantation

Patient survival, graft survival and cause of death analyses were undertaken on historic incident and prevalent cohorts to allow sufficient follow-up time.

The analyses were undertaken using UK Renal Registry (UKRR) data combined with NHS Blood and Transplant (NHSBT) data through a data sharing agreement.

This chapter addresses the following key aspects of the care of patients with a functioning kidney Tx for which there are UK Kidney Association guidelines (table 4.1):

- **Complications associated with CKD and kidney transplantation:** these include anaemia, mineral bone disorders and dyslipidaemia
- **Blood pressure:** attainment of blood pressure targets are reported, although data completeness does not allow differentiation based on levels of proteinuria.

Rationale for analyses

The analyses begin with a brief summary of the number and type of kidney Tx undertaken in recent years in the UK as well as early graft and patient survival. More detailed results are available at organdonation.nhs.uk/helping-you-to-decide/about-organ-donation/statistics-about-organ-donation. The 2020 prevalent adult Tx population is described, including the number transplanted per million population (pmp).

The UK Kidney Association guidelines (ukkidney.org/health-professionals/guidelines/guidelines-commentaries) provide audit measures relevant to the care of patients with a Tx, and where data permit, their attainment by UK kidney centres in 2020 is reported in this chapter (table 4.1). Audit measures in guidelines that have been archived are not included.

Some audit measures in current guidelines cannot be reported because the completeness of the required data items is too low. Further detail about the completeness of data returned to the UKRR is available through the UKRR data portal (ukkidney.org/audit-research/data-portals). Audit measures that cannot be reported because the required data items were not collected by the UKRR are omitted. The chapter includes analyses carried out by Getting It Right First Time (GIRFT), a national programme designed to reduce unwarranted variation in medical care provided by the NHS by sharing best practice. The GIRFT metrics for kidney services, analysed in collaboration with the UKRR, were based on data derived from multiple sources and included equity of access to services, outcomes and pathways in nephrology, dialysis and transplantation.

Table 4.1 The UK Kidney Association audit measures relevant to Tx that are reported in this chapter

The UK Kidney Association guideline	Audit criteria	Related analysis/analyses
Post-operative care in the kidney Tx recipient (2017)	Proportion of patients receiving a target blood pressure of 140/90 mmHg or 130/80 mmHg in the presence of proteinuria – protein:creatinine ratio >100 mg/mmol or albumin:creatinine ratio >70 mg/mmol	Table 4.8, figures 4.13–4.14 (proteinuria was not adequately collected)
	Proportion of patients achieving dyslipidaemia targets	Table 4.8
	Incidence of hyperparathyroidism	Table 4.8
	Prevalence of anaemia	Table 4.8, figures 4.11–4.12
Anaemia (2020)	Treatment guidelines for anaemia in kidney Tx patients should be similar to those for CKD patients not on dialysis	Table 4.8, figures 4.11–4.12

In 2020, 23 of the 68 adult kidney centres in the UK were Tx centres – 19 in England, two in Scotland and one in each of Northern Ireland and Wales.

For definitions and methods relating to this chapter see appendix A. Centres were excluded from caterpillar plots and cells were blanked in tables where data completeness for a biochemical variable was <70% and/or the number of patients reported was <10. The number preceding the centre name in each caterpillar plot indicates the percentage of missing data for that centre.

As Colchester kidney centre did not have any Tx patients they were excluded from some of the analyses, although their dialysis patients were included in the relevant dialysis population denominators.

Key findings

- 38,895 adult patients had a kidney Tx for ESKD in the UK on 31/12/2020, which represented 57.0% of the KRT population.
- The median age of kidney Tx patients was 56.0 years and 60.8% were male.
- There was a 29% reduction in overall kidney Tx performed in 2020 compared to 2019, with a decrease in kidney Tx from LKDs by 44%, DCDs by 33% and 14% DBDs. This is likely due to COVID disruption of transplant pathways.
- The median eGFR for kidney Tx patients 1 year after transplantation was 56.8 mL/min/1.73m² from LKD, 51.8 mL/min/1.73m² from DBD and 47.7 mL/min/1.73m² from DCD.
- 15.9% of kidney Tx patients had eGFR <30 mL/min/1.73m².
- The median decline in eGFR slope beyond the first year after transplantation was 0.8 mL/min/1.73m²/year.
- There was no cause of death data available for 38.4% of deaths on Tx. For those Tx patients with data, the leading cause of death was infection (32%) compared to (18.7%) the previous year and the increase is most likely due to an increase in COVID related deaths.

Analyses

Kidney Tx activity

NHSBT provided the UKRR with summary data on kidney Tx activity (table 4.2). More detailed results are available at organdonation.nhs.uk/helping-you-to-decide/about-organ-donation/statistics-about-organ-donation. The number of patients receiving a pre-emptive Tx is reported by centre in chapter 2.

Table 4.2 Number of kidney and kidney plus other organ Tx (adult and paediatric) in the UK, 2018–2020 calendar years

Organ	2018	2019	2020	% change 2019-2020
Kidney DBD ¹	1,466	1,417	1,220	-14
Kidney DCD ²	940	1024	683	-33
Kidney LKD	1,036	1,042	586	-44
Kidney and liver ³	18	18	5	
Kidney and heart	0	1	0	
Kidney and pancreas ⁴	174	157	97	-38
Kidney and pancreas islets ⁵	3	4	0	
Small bowel (inc kidney)	7	7	4	
Total kidney Tx	3,644	3,670	2,595	-29

¹Includes en bloc transplants (6 in 2018, 5 in 2019, and 2 in 2020) and double kidney transplants (14 in 2018, 18 in 2019, 10 in 2020)

²Includes en bloc transplants (8 in 2018, 3 in 2019, and 2 in 2020) and double kidney transplants (15 in 2018, 24 in 2019, and 9 in 2020)

³Includes DCD transplants (48 in 2018, 45 in 2019, and 23 in 2020)

⁴Includes DCD transplants (1 in 2020)

⁵Includes DCD transplants (3 in 2018 and 2 in 2020)

DBD – donor after brain death; DCD – donor after circulatory death; LKD – living kidney donor

Variation in the proportion of patients who received an LKD Tx or were on the Tx waiting list within two years of KRT start, is shown for patients incident to KRT in 2018, adjusted by sex, age and primary renal disease (PRD) (figure 4.2). The analysis for LKD transplantation only is shown separately (figure 4.3).

Figure 4.2 Percentage of adult patients incident to KRT in 2018 who were waitlisted or received a living kidney donor (LKD) Tx within 2 years of KRT start adjusted by age, sex and primary renal disease by centre

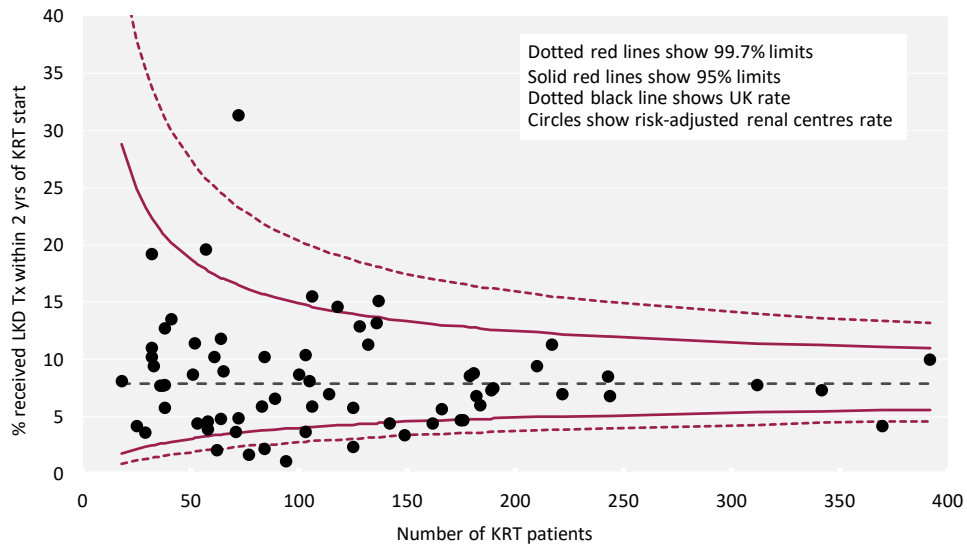

Figure 4.3 Percentage of adult patients incident to KRT in 2018 who received a living kidney donor (LKD) Tx within 2 years of KRT start adjusted by age, sex and primary renal disease by centre

Early kidney Tx outcomes

Kidney Tx recipient outcome data from NHSBT were reported against the Tx centre rather than the referring centre (table 4.3). Note that the survival rates were risk-adjusted and used financial year cohorts as per NHSBT methodology (see table footnote).

Table 4.3 Risk-adjusted first adult kidney-only Tx, graft and patient survival by Tx type and Tx centre¹ (cohorts detailed in footnote)

Cohorts for survival rate estimation: 1 year survival: 1/4/2016–31/03/2020; 5 year survival: 1/4/2012–31/3/2016; first grafts only – re-grafts excluded for patient survival estimation. Since the cohorts to estimate 1 and 5 year survival are different, some centres may appear to have 5 year survival better than 1 year survival.

¹Information courtesy of NHSBT: number of Tx, patients and 95% confidence intervals (CI) for each estimate; statistical methodology for computing risk-adjusted estimates can be obtained from NHSBT (<https://nhsbt.dbe.blob.core.windows.net/umbraco-assets-corp/20032/kidney-annual-report-2019-20-final.pdf>).

Kidney graft function at one year post-Tx was assessed using median eGFR by donor type and by centre using a seven year cohort (patients with graft failure including death with a functioning graft were excluded). The data completeness at one year after Tx (for Tx occurring 2013–2019) was 97.3%.

Figure 4.4 Median estimated glomerular filtration rate (eGFR) for kidney Tx at 1 year by donor type and year of transplantation between 2013 and 2019

DBD – donor after brain death; DCD – donor after circulatory death; LKD – living kidney donor

Figure 4.6 Median estimated glomerular filtration rate (eGFR) at 1 year post-donor after brain death (DBD) Tx by transplanting centre for transplantation that occurred between 2013 and 2019

Figure 4.7 Median estimated glomerular filtration rate (eGFR) at 1 year post-donor after circulatory death (DCD) Tx by transplanting centre for transplantation that occurred between 2013 and 2019

Changes to the prevalent adult kidney Tx population

Tx recipients are under the care of a Tx centre around the time of transplantation, but the policy of when to repatriate to the referring centre varies. When data entries for patients were received from more than one centre they were attributed to the referring centre.

Table 4.4 Percentage completeness of estimated glomerular filtration rate (eGFR), blood pressure, haemoglobin, total cholesterol, adjusted calcium, phosphate and parathyroid hormone (PTH) by centre for adult patients prevalent to Tx on 31/12/2020

Blank cells – no data returned by the centre.

Patients who had been on Tx for <3 months were excluded from this analysis, including N with Tx.

Scottish centres were excluded from blood pressure, cholesterol and PTH analyses because the Scottish Renal Registry does not share these data items with the UKRR. UK completeness excludes Scotland for these analyses.

Patients with missing ethnicity were classed as White for the eGFR calculation.

For the 68 adult kidney centres, the number of prevalent patients with a Tx was calculated as both a proportion of the prevalent patients on KRT and as a proportion of the estimated centre catchment population (calculated as detailed in appendix A).

Table 4.5 Number of prevalent adult Tx patients and proportion of adult KRT patients with a Tx by year and by centre; number of Tx patients as a proportion of the catchment population

Country Tx populations were calculated by summing the Tx patients from centres in each country. Estimated country populations were derived from Office for National Statistics figures. See appendix A for details on estimated catchment population by kidney centre. pmp – per million population

Demographics of prevalent adult kidney Tx patients

The proportion of Tx patients from each ethnic group is shown for patients with ethnicity data – the proportion of centre patients with no ethnicity data is shown separately.

Blank cells – no data returned by the centre or data completeness <70%.

Breakdown by ethnicity is not shown for centres with <70% data completeness, but these centres were included in national averages.

Figure 4.8 Adult Tx prevalence rate on 31/12/2020 by age group and sex
pmp – per million population

The distribution of primary renal diseases (PRDs) as a cause of ESKD in the incident Tx population is compared to the prevalent Tx population (table 4.7). Comparison to dialysis populations is shown in chapter 3. PRDs were grouped into categories, with the mapping of disease codes into groups explained in more detail in appendix A. The proportion of Tx patients with each PRD is shown for patients with PRD data and these total 100% of patients with data. The proportion of patients with no PRD data is shown on a separate line.

Table 4.7 Primary renal diseases (PRDs) of adult patients incident to Tx in 2020 and adult patients prevalent to Tx on 31/12/2020

PRD	Incident Tx		Prevalent Tx	
	N	%	N	%
Diabetes	403	17.0	4,599	12.0

Other	454	19.1	7,323	19.1
Uncertain aetiology	331	13.9	5,386	14.0
Total (with data)	2,373	100.0	38,389	100.0
Missing	96	3.9	506	1.3

Graft function and anaemia in prevalent adult kidney Tx patients

Accepting the limitations of interpreting eGFR in the post-Tx population, analyses by centres were divided into the proportion of patients with eGFR greater or less than 30 mL/min/1.73m² and the proportion of patients achieving an adequate haemoglobin level (defined as a haemoglobin ≥100 g/L).

Figure 4.9 Median estimated glomerular filtration rate (eGFR) in adult patients prevalent to Tx on 31/12/2020 by centre

Figure 4.10 Percentage of adult patients prevalent to Tx on 31/12/2020 with an estimated glomerular filtration rate (eGFR) <30mL/min/1.73m² by centre
CI – confidence interval

Figure 4.11 Percentage of adult patients prevalent to Tx on 31/12/2020 with an estimated glomerular filtration rate (eGFR) $\geq 30\text{mL}/\text{min}/1.73\text{m}^2$ achieving haemoglobin (Hb) $\geq 100\text{g}/\text{L}$ by centre
CI – confidence interval

Figure 4.12 Percentage of adult patients prevalent to Tx on 31/12/2020 with an estimated glomerular filtration rate (eGFR) $< 30\text{mL}/\text{min}/1.73\text{m}^2$ achieving haemoglobin (Hb) $\geq 100\text{g}/\text{L}$ by centre
CI – confidence interval

Blood pressure in prevalent adult kidney Tx patients

Blood pressure data completeness was variable (table 4.4) and only centres with $\geq 70\%$ data completeness were included in the analysis. It is possible that bias may be introduced if blood pressure readings in particular ranges were more frequently reported. A lack of data on proteinuria did not allow differentiation for the purposes of reporting against the audit measure.

Figure 4.13 Percentage of adult patients prevalent to Tx on 31/12/2020 with estimated glomerular filtration rate (eGFR) ≥ 30 mL/min/1.73m² achieving blood pressure of <140/90 mmHg by centre
CI – confidence interval; DBP – diastolic blood pressure; SBP – systolic blood pressure

Figure 4.14 Percentage of adult patients prevalent to Tx on 31/12/2020 with estimated glomerular filtration rate (eGFR) <30 mL/min/1.73m² achieving blood pressure of <140/90 mmHg by centre
CI – confidence interval; DBP – diastolic blood pressure; SBP – systolic blood pressure

Biochemistry parameters in prevalent adult kidney Tx patients

The attainment of audit standards is shown by stage of Tx kidney function in the prevalent Tx population and by comparing to the prevalent dialysis population.

Table 4.8 Estimated glomerular filtration rate (eGFR), blood pressure and biochemical parameters in adult patients prevalent to Tx on 31/12/2020 compared with adult patients prevalent to dialysis on 31/12/2020 by CKD stage

Characteristic	Tx CKD stage (eGFR)				Prevalent dialysis Stage 5D
	Stage 1-2T (≥ 60 mL/min/1.73 m ²)	Stage 3T (30-59 mL/min/1.73 m ²)	Stage 4T (15-29 mL/min/1.73 m ²)	Stage 5T (<15 mL/min/1.73 m ²)	
N	10,516	16,361	4,277	790	22,714
%	32.9	51.2	13.4	2.5	
eGFR (mL/min/1.73m²)					
mean \pm SD	76.6 \pm 13.3	45.1 \pm 8.4	23.6 \pm 4.2	11.6 \pm 2.5	
median	73.3	45.2	24.1	12.0	
SBP (mmHg)					
mean \pm SD	135 \pm 17	138 \pm 18	141 \pm 19	146 \pm 21	137 \pm 26
% ≥ 140 mmHg	33.3	41.4	50.0	60.7	43.4

% <100 g/L	1.4	3.3	13.5	32.1	19.2
Phosphate (mmol/L)					
mean \pm SD	1.0 \pm 0.2	1.0 \pm 0.2	1.1 \pm 0.2	1.5 \pm 0.4	1.7 \pm 0.4
% >1.7 mmol/L	0.2	0.3	1.8	21.7	40.6
Adjusted Ca (mmol/L)					
mean \pm SD	2.4 \pm 0.1	2.4 \pm 0.1	2.4 \pm 0.1	2.3 \pm 0.2	2.3 \pm 0.2
% >2.5 mmol/L	20.5	21.8	17.5	11.9	15.0
% <2.2 mmol/L	3.4	4.0	7.4	18.0	17.6
PTH (pmol/L)					
median	8.7	9.8	16.1	27.9	32.7
% >72 pmol/L	0.3	0.8	3.9	12.6	17.7

Scottish centres are excluded from all analyses as they have not submitted any biochemistry or blood pressure data for 2020.

Ca – adjusted calcium; DBP – diastolic blood pressure; PTH – parathyroid hormone; SBP – systolic blood pressure; SD – standard deviation

Differences in the median eGFR slope in Tx patients is reported by patient and Tx graft characteristics. All UK patients aged at least 18 years receiving their first kidney Tx between 01/01/2010 and 31/12/2018 were considered for inclusion. A minimum duration of 18 months graft function was required and three or more creatinine measurements from the second year of graft function onwards were used to plot eGFR slope. If a Tx failed, but there were at least three creatinine measurements between one year post-Tx and graft failure, the patient was included, but no creatinine measurements after the quarter preceding the recorded date of Tx failure were analysed.

Table 4.9 Differences in median estimated glomerular filtration rate (eGFR) slope between demographic subgroups of adult patients who received their first kidney Tx between 01/01/2010 and 31/12/2018

Characteristic	N	Median slope	Lower quartile	Upper quartile
Age at Tx (yrs)				
<40	4,854	-1.48	-4.74	0.81
40-55	8,087	-0.62	-3.02	1.20
>55	7,247	-0.65	-3.08	1.14
Ethnicity				
White	14,372	-0.67	-3.09	1.12

Survival of adult kidney Tx patients

Survival of incident and prevalent KRT patients is described in detail in chapters 2 and 3, respectively. Survival of incident Tx patients is reported in table 4.3. NHSBT reports the survival of Tx recipients.

Cause of death in adult kidney Tx patients

Cause of death was analysed in patients prevalent to KRT on 31/12/2019 and followed-up for one year in 2020, with comparisons between Tx and dialysis presented in table 4.10. Work is being undertaken to better understand and code the cause of death in Tx recipients. The proportion of KRT patients with each cause of death is shown for patients with cause of death data and these total 100% of patients with data. The proportion of patients with no cause of death data is shown on a separate line.

Table 4.10 Cause of death in adult patients prevalent to KRT on 31/12/2019 followed-up in 2020 by modality

Cause of death	All modalities		Dialysis		Tx	
	N	%	N	%	N	%
Cardiac disease	755	17.4	647	18.7	108	12.3
Cerebrovascular disease	124	2.9	96	2.8	28	3.2
Infection	1,258	29.0	977	28.3	281	32.0
Malignancy	335	7.7	180	5.2	155	17.7
Treatment withdrawal	552	12.7	532	15.4	20	2.3
Other	982	22.7	764	22.1	218	24.8
Uncertain aetiology	329	7.6	261	7.5	68	7.7
Total (with data)	4,335	100.0	3,457	100.0	878	100.0
Missing	2,330	35.0	1,782	34.0	548	38.4
